		ADDITIONAL INFORMATION:	

Situation:

The 4155A/4156A/41501A units within the listed serial number range, and having a power supply module with an EDC (Engineering Date Code) less than 3424, may have a power supply shut-down problem. This problem shows the following phenomena.

- Units hang up during the power on selftest.
- CAUTION 308: Unknown emergency (SMUC time out) is displayed intermittently during the operation.
- During the operation, power of the units is cycling and all LEDs on the front panel will be flashing.

Solution/Action:

Replace a faulty power supply module of the units using an exchange program. Power supply modules with an EDC equal to 3424 or greater have been modified at the factory, and SMO/SME already stocks the modified power supply modules as an exchange part.

An EDC is in the form YYWW and is usually found on a white label on the side panel of power supply modules.

Where: YY=YEAR-1960 (Example: If YY=33, the year is 1993)

WW=WEEK (Example: If WW=20, it indicates the 20th week of YY)

Following shows an example of a label that lists an EDC.

04155-60003
33-3424 << 3424 is the EDC
00484-3427
MADE IN JAPAN

If the 4155A/4156A has the 41501A expander, it is required to replace both power supply of the 4155A/4156A and 41501A.
