Situation:

Due to variations in component locations within the power supply (a purchased part) , if components are tilted the wrong way the current screw (0515-0372) is long enough to cause a high pot failure. Since all instruments are high pot tested before being shipped, there is no problem with instruments already in the field. When a power supply is replaced, the 3 mounting screws on the bottom of the instrument should be changed to a shorter screw (0515-0430) to eliminate any potential problem. With the old screws, even if the part spacing becomes too close to cause a high pot failure, there is NO safety issue.

Solution/Action:

In analog instrument, when a power supply is replaced, replace the 3 mounting screws that hold the power supply with part number 0515-0430. (See picture for parts location).
